产品概要 Product Summary

用途 Application	256X48 Dots, 1Color	概要 Summary
显示颜色	绿色 Green	64Grid X 192 Anode 1Colors
Color Of Illumination	X= 0.250 Y = 0.440	Cadmium Free Phosphor

装配参数 Assembly parameters											
	长 Panel Length	136.0	mm								
外形尺寸	宽 Panel Height	40.0	mm								
Outer Dimensions	厚 Panel Thickness	9.0	mm								
引出端子 Lead	端子间距 Lead Pitch	2.0	mm								
了正场于 Lead	端子引出形式 Lead Out	单列折弯 Single	column bending								

极限工作条件 Absolute Maximum Condition

*以下所有项目不得超过最大值,否则会对产品造成不可逆的损坏。

*All the following items shall not exceed the maximum value, otherwise the product will be irreversibly damaged.

项目 Item	符号 Symbol	端子符号 Terminals	变动范围 Ratings	单位 Unit
灯丝电压 Filament Voltage	Ef	F+ F-	2.5 - 7	Vdc
逻辑电压 Logic Voltage	VDD	VDD	-0.3 - 4.5	Vdc
栅极驱动电压 Grid Driver Voltage	VHG	VHG	-0.3 - 75.0	Vdc
阳极驱动电压 Anode Driver Voltage	VHP	VHP	-0.3 - 100.0	Vdc
使用温度 Operating Temperature	Тор		-40 - +70	°C

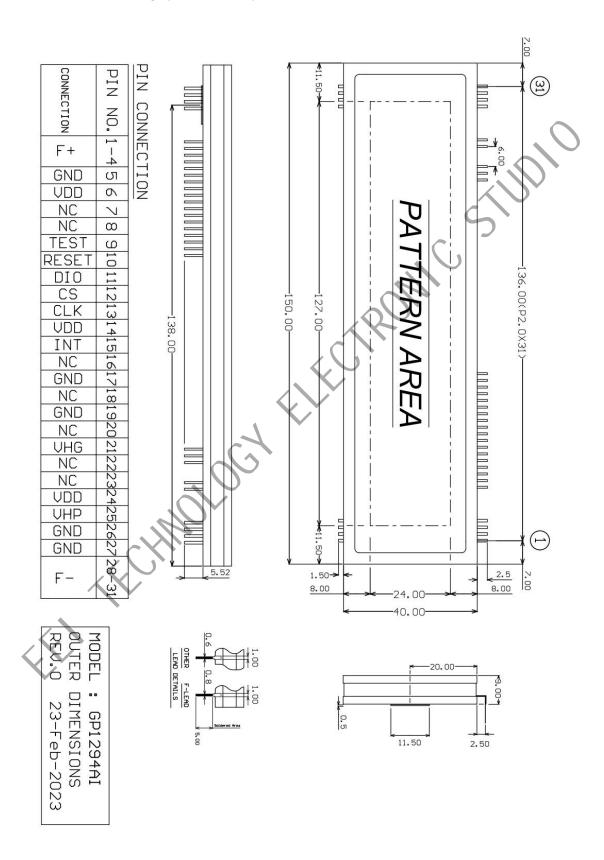

推荐工作条件 Recommended Operating Condition

项目	符号	条件	最小值	推荐值	最大值	单位
Item	Symbol	Condition	Min	TYP	Max	Unit
灯丝电压	Ef		3.2	3.4	4	Vdc
Filament Voltage	EI		3.2	3.4	4	vuc
截止电压	Ek			2.5		Vdc
Cut-Off Voltage	_ ⊏K			2.5		vac
逻辑电压	VDD		3.0	3.3	2.6	Vdc
Logic Voltage	VUU		3.0	3.3	3.6	vac
阳极驱动电压	VHP			75.0	90.0	Vdc
Anode Driver Voltage	VIIF			13.0	90.0	vuc
栅极驱动电压	VHG			50.0	65.0	Vdc
Grid Driver Voltage	VIIG			30.0	03.0	vuc
逻辑高电平输入	VIH	RESET,CS,CLK,DIO	VDD x 0.8			Vdc
Hi-Level Logic Input	VIII	RESET, CS, CER, DIO	V U U X 0.0	·		vuc
逻辑低电平输入	VIL	RESET,CS,CLK,DIO	,Q		VDD x 0.2	Vdc
Lo-Level Logic Input	VIL	KLSL1,CS,CLK,DIO			V D D X U.Z	vuc

功能表 Function Table

功能 Function	符号 Symbol	输入/ 输出 Input/ Output	描述 Description
测试端 TEST PIN	TEST	Input	Connect it with VDD
串行数据输入 Serial Data Input	DIO	Input/ Output	Serial Data Input,LSB First
片选信号 Chip Select Input	CS	Input	Chip Select,LOW Active
串行时钟输入 Serial Clock Input	CLK	Input	Serial Clock Input
复位输入 Reset Input	RESET	Input	Reset Input,LOW Active
帧同步中断输出 Frame Sync Interrupt Output	INT	Output	T1 INT Output
逻辑电源输入 Logic Power Input	VDD	Input	Power Pin For Logic Circuit
栅极驱动电源输入 Grid Driver Power Input	VHG	Input	Power Pin For Grid Driver
阳极驱动电源输入 Anode Driver Power Input	VHP	Input	Power Pin For Anode Driver
灯丝电源输入 Filament Power Input	F+,F-	Input	Filament Power Input

指令概要 Command Summary

0xAA	软件复位 Software Reset										
Bit	B1	B2	В3	B4	B5	B6	В7	B8	Hex		
指令 Command	1	0	1	0	1	0	1	0	0xAA		
参数 Parameter				-	-						
内容 Description	(2) (1) (2)	The display p	由于"SC1"被 performs a so the register'	置 1,所以」 oftware reset, SC" bit will b	e set to 1, so	e written with the screen v	vill not displa	et default value y. software reset.	·s.		

UXOU	製用少中的制工 以及 Frame Sync Setting											
Bit	B1	B2	В3	B4	B5	В6	В7	В8	Hex			
指令 Command	0	0	0	0	1	0	0	0	0x08			
参数 1 Parameter 1 st	*	*	*	*	*	*	ACT	INT				
	此命令用于设置帧同步中断输出。This command is used to set the frame synchronization interrupt output. (1) 当屏幕扫描到 G1 时,帧同步中断会被触发。											
内容 Description	(2) INT =	= 0,不输出中	断信号,AC	T=0,INT=1 F	中断低有效输	〕出,ACT=1	INT=1 中断	高有效输出				
	(1) When	(1) When the screen is scanned to G1, the frame synchronization interrupt will be triggered.										
	(2) INT=	0:INT is LOW	Output A	CT=0,INT=1:	INT LOW Act	ive ACT=1	INT=1:INT H	IGH Active				

GP1294AI

清除显存数据 Clear GRAM									
	GP1294AI 控制器不支持显存清零指令,需使用写显存指令(0xF0)进行清零								
	GP1294Al controller does not support the memory clear command, you need to use the "write memory"(0xF0) command to clear the memory								
	2 * 3 * 4 * Example of Clear GRAM 5 * 6 */								
	7 8⊖ void ClearGRAM()								
操作示例	9 { 10								
Example of Clear GRAM	WriteCommand(0xf0); // write GRAM Command WriteData(0x00); // parameter 1st X Position (0) WriteData(0x00); // parameter 2nd Y Position (2) WriteData(0x7f); // parameter 2rd Y Return Length (128)								
	for(uint16_t i = 0; i < ((256 * 128) / 8); i++) // 256x128 GRAM for(uint16_t i = 0; i < ((256 * 128) / 8); i++) // 256x128 GRAM writeData(0x00); // clear GRAM Tramsmit_end_cb(); // end transmit_"CSUPin set high								
	23 } 24								

0xA0	屏幕亮度调节 Display brightness adjust								
Bit	B1	B2	В3	В4	B5	В6	В7	В8	Hex
指令 Command	1	0	1	0	Ø	0	0	0	0xA0
参数 1 Parameter 1 st	L7	L6	L5	L4	L3	L2	L1	L0	
参数 2 Parameter 2 nd	*	*	*	*	*	*	L9	L8	

此命令用于调节屏幕亮度。This command is used to adjust the screen brightness.

内容 Description

- (1) 为了减缓屏幕老化,建议将亮度值设定在500 (DEC) 以下
- $(1) \ \ \text{In order to delay the aging of the display , it is recommended to control the brightness value below 500 (DEC)}$

0x80		显示模式设定 Display mode setting								
Bit	B1	B2	В3	B4	B5	В6	В7	B8	Hex	
指令 Command	1	0	0	0	0	0	0	0	0x80	
参数 1 Parameter 1 st	0	0	*	SC	HS	LS	*	NP		

此命令用于设置显示模式。This command is used to set the display mode.

位 Bit				功能 Function					
SC	HS	LS	NP	A)HE I UNCUOII					
1	*	*	*	停止扫描 Stop scan					
0	*	1	*	全熄灯 All light off					
0	1	0	*	全点灯 All light on					
0	0	0	0	正片扫描 Positive Scan					
0	0	0	1	负片扫描 Invert Scan					

内容 Description

GP1294AI

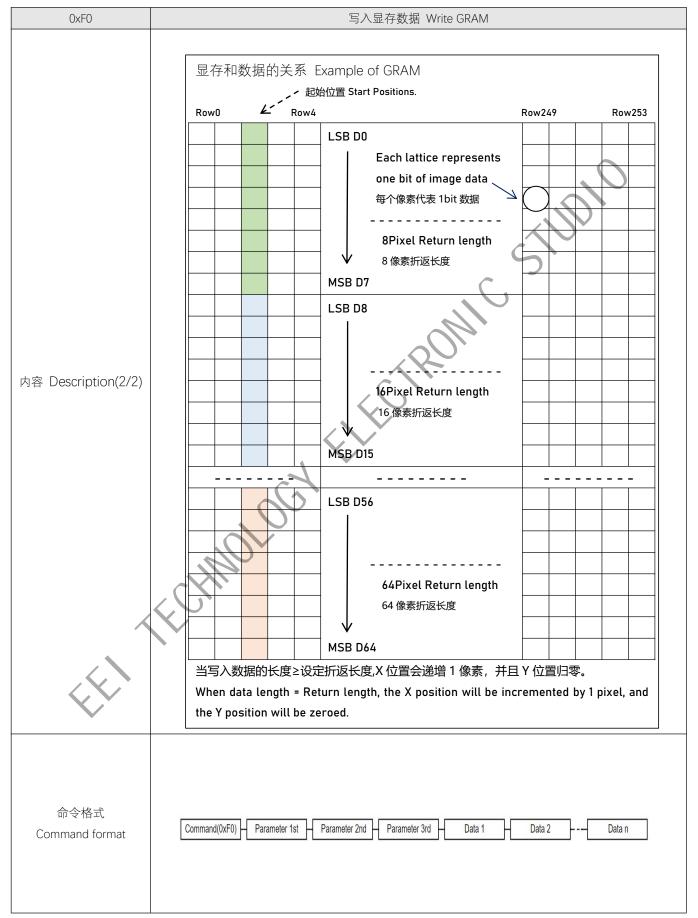

0xF0		写入显存数据 Write GRAM								
Bit	B1	B2	В3	В4	B5	В6	В7	B8	Hex	
指令 Command	1	1	1	1	0	0	0	0	0xF0	
参数 1 Parameter 1 st	X7	X6	X5	X4	X3	X2	X1	X0	00h-FFh	
参数 2 Parameter 2 nd	*	Y6	Y5	Y4	Y3	Y2	Y1	Y0	00h-7Fh	
参数 3 Parameter 3 rd	*	C6	C5	C4	C3	C2	C1	C0	00h-7Fh	
数据 1 Data 1 st	D7	D6	D5	D4	D3	D2	D1	D0		
数据 N Data n	D7	D6	D5	D4	D3	D2	D1	D0	<u> </u>	

此命令用于写入显存。This command is used to write GRAM.

- (1) 执行此命令时, X(7:0)Y(6:0)将会被重置。
- (2) 显存写入起始位置由 X(7:0)和 Y(6:0)决定, 当写入操作完成, Y 轴会进行自动递增。
- (3) 当 Y 轴写入位置递增到 C(6:0)指定位置时 Y 轴折返回零, X 轴写入位置自动递增 1 像素。
- (4) 当 X 轴递增到 253 并且 Y 轴已递增到 C(6:0), 此时如果再写入数据, 数据将无效。
- (5) 注意: 折返长度必须是 8 的整数倍,折返长度 = C(6:0) + 1,即 0x07 = 8,0x7F = 128。
- (1) When this command is executed, X (7:0) Y (6:0) will be reserved.
- (2) The starting position of GRAM writing is determined by X (7:0) and Y (6:0). When the writing operation is completed, the Y axis will automatically increase.
- (3) When the Y-axis writing position is increased to the specified position of C (6:0), the Y-axis returns to zero, and the X-axis writing position is automatically increased by 1 pixel.
- (4) When the X-axis increments to 253 and the Y-axis has incremented to C(6:0), if data is written again at this time, the data will be invalid.
- (5) Note: The turn-back length must be an integral multiple of 8,Turn-back length=C (6:0)+1, i.e. 0x07=8, 0x7F=128.

内容 Description(1/2)

操作示意图 Schematic 256 x 128 dot RAM x axis (0, 0) (255, 0) Return Length (c)(6:0) (0, 128)

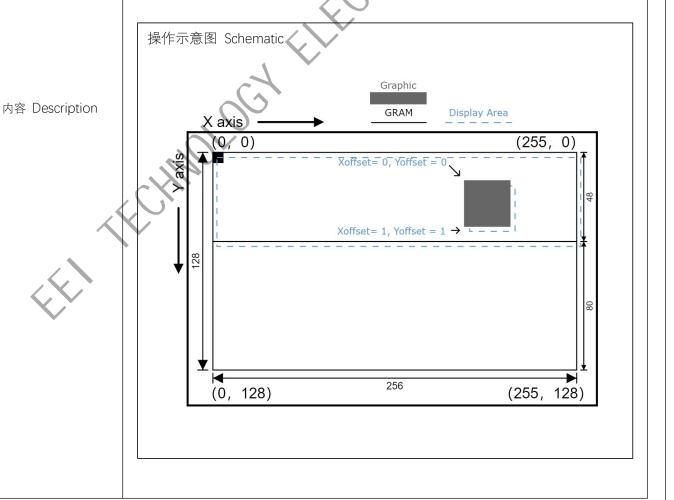

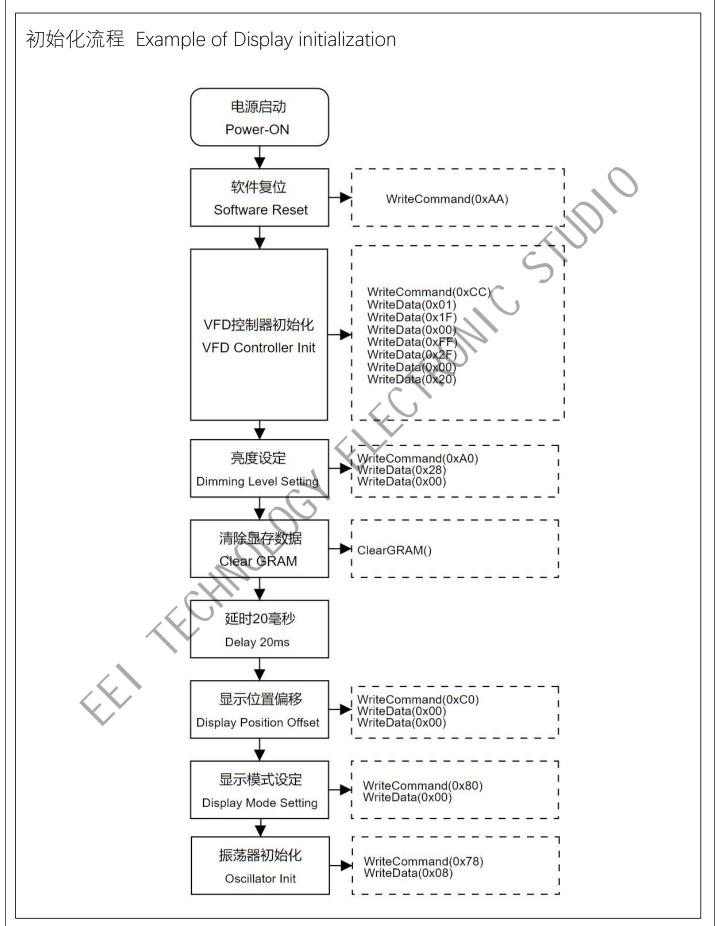

GP1294AI

0xC0	显示位置偏移 Display Position Offset								
Bit	B1	B2	В3	В4	B5	В6	В7	B8	Hex
指令 Command	1	1	0	0	0	0	0	0	0xC0
参数 1 Parameter 1 st	X7	X6	X5	X4	X3	X2	X1	X0	00h-FFh
参数 2 Parameter 2 nd	*	Y6	Y5	Y4	Y3	Y2	Y1	Y0	00h-7Fh

此命令用于偏移显示区域。This command is used to offset the display area.

- (1) X[7:0],Y[6:0]均为 0 时,显示位置刚好与显存对齐。
- (2) 请勿将偏移值超过显存尺寸,否则显示将会发生异常。
- (1) When X [7:0] and Y [6:0] are both 0, the display position is just aligned with the GRAM
- (2) Do not set the offset value to exceed the memory size, otherwise the display will be abnormal.

显示流程 Example of Display 初始化 Initialization NO 显示数据更新 Display Data Renewed YES 发送数据到显存 Send Data to GRAM 屏幕完成显示 The VFD Light Up
